For over 30 years Innovative Electronic Designs LLC (IED) has set the standard for large-scale audio and visual paging systems. Many of the original 500ACS units are still in service at airports and facilities around the world; IED has redefined announcement control systems with the introduction of the GLOBALCOM vACS. The vACS is the culmination of years of research and development to provide a solution that can meet the needs of any facility large or small today and into the future.

The vACS is a network-centric announcement and message management system designed to control audio and visual announcements in facilities of all sizes. A single vACS application can manage hundreds of IED Network Paging Stations and Network Amplifier end-points on a single LAN/vLAN. For even larger facilities, the vACS provides full bandwidth, real-time announcements and messages over WAN networks to create systems of any size. Additionally the scalability and smaller investment of the vACS allows any size facility to benefit from the extensive control and comprehensive feature set

The vACS expands the features and capabilities of the industry standard 500ACS at a new level of performance and long term value.

"The completion and release of the vACS is the single biggest thing that has happened to IED in twenty years", said Hardy Martin CTO at IED. "This product encompasses all that we have learned over the years in constructing complex communications systems for some of the biggest facilities in the world. The scalability and extensive feature set in this product make it unlike anything else in the market today and we are excited to be able to bring it to our dealers and their customers".

IED - Often Imitated, Never Duplicated
