Top 5 Best Practices for Digital Systems Designs

Installing digital systems can be challenging if you don't know what to look for or how to identify the cause of errors. In this free CI Partner Series webinar, Kramer will explore the **Five Best Practices for Digital System Designs**. As our industry moves forward into digital signal transmission, a new methodology of troubleshooting and design must be adopted.

During the presentation, we will discuss what symptoms you may see in a digital system and offer what we feel are the **Five Best Practices** to implement. By avoiding digital conflicts, either in design or installation, you will be able to ensure that you create a system that is operational and trouble free the first time!

In turn saving both integrators and clients precious hours and money.

We will do this by discussing how to develop new ways of insuring system signal flow success, troubleshooting techniques, cabling infrastructure and more.

Presenter is Malissa Dillman, CTS-D, CTS-I; Kramer's Training & Education Manager & InfoComm Educator of the Year!
