How to Build an Air-Tight Digital Signage Network

We hear and read a lot of about digital signage as an exciting opportunity for integration firms, but very few resources address the nitty-gritty details of actually building and executing a reliable and dynamic digital signage network for your clients. This exclusive Kramer/Commercial Integrator Partner Series Webinar does just that.

Dave Haar, Kramer's VP of digital signage solutions, will explain the importance of making sure you have covered all of the bases, to ensure the success of your digital signage network.

We will offer digital signage network design best practices for:

- Content creation options
- Content management
- Screens
- Extension and distribution solutions

Haar will also take a particularly close look at extension and distribution solutions, and how they can save you time and money when used in your digital signage deployment.

This free webinar is about 45 minutes—a short amount of time to invest in learning how to build an air-tight digital signage network for your clients.
